

Learning Outcomes

At the end of the session, you will be able to:

- Install, write, and run R program using RStudio
- Explain the basic R syntax, variables, and mathematical operations

Activity

1. Write a R code to create a sequence of 20 numbers. The program will calculate and display the square of the number sequence.

```
num = seq(from = 1, to = 20)
square = num**2
print(square)
```

2. Given two variables, num1=0.956786 and num2=7.8345901. Write a R code to display the num1 value in 2 decimal point number, and num2 value in 3 decimal point number (clue: use function round()).

```
num1=0.956786
num2=7.8345901
print(round(num1,2))
print(round(num2,3))
```

3. Write a R code that retrieves from the user the radius value of a circle. The program will calculate and display the circle's area.

```
radius <- readline(prompt="Enter radius: ")
radius = as.numeric(radius)
pi = 3.14
area = pi *(radius**2)
print(area)
```

Submission

- Submit to your GA.
